Executive Summary

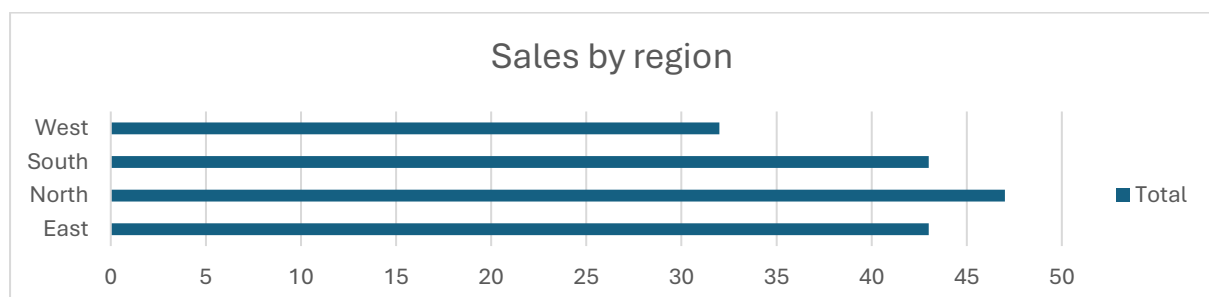

This project is intended to assess our ability to use Linux, Python and excel to perform data cleaning and analysis. The Linux task consists of automating a shell script to create a workflow that includes installing packages, running python script and logging execution status. The python tasks consist of running functions to read and analyse uncleaned data, apply data cleaning operations as well as aggregate data and produce the output to new csv files. The excel tasks consists of using the cleaned data to produce pivot tables for deeper analysis. With these Pivot tables we can perform power functions to our data and generate interactive and aesthetic dashboards for a visual representation. With the Pivot tables and dashboards, we can use the deeper analysis to see trends and get insight into the performance of the business. Understanding this can further enhance the performance of the business.

Introduction

Upon the completion of the work flow I was able to extract the cleaned data and perform an analysis using excels pivot tables and dashboard with charts to gain valuable insights. In this report I will share my findings.

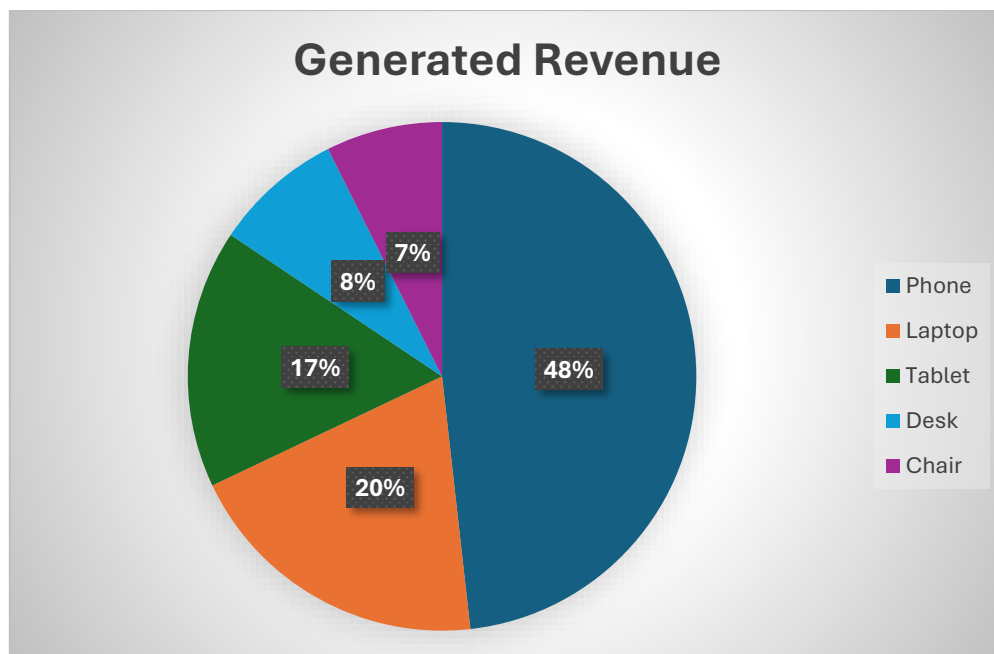

My Findings

1. Top performing region

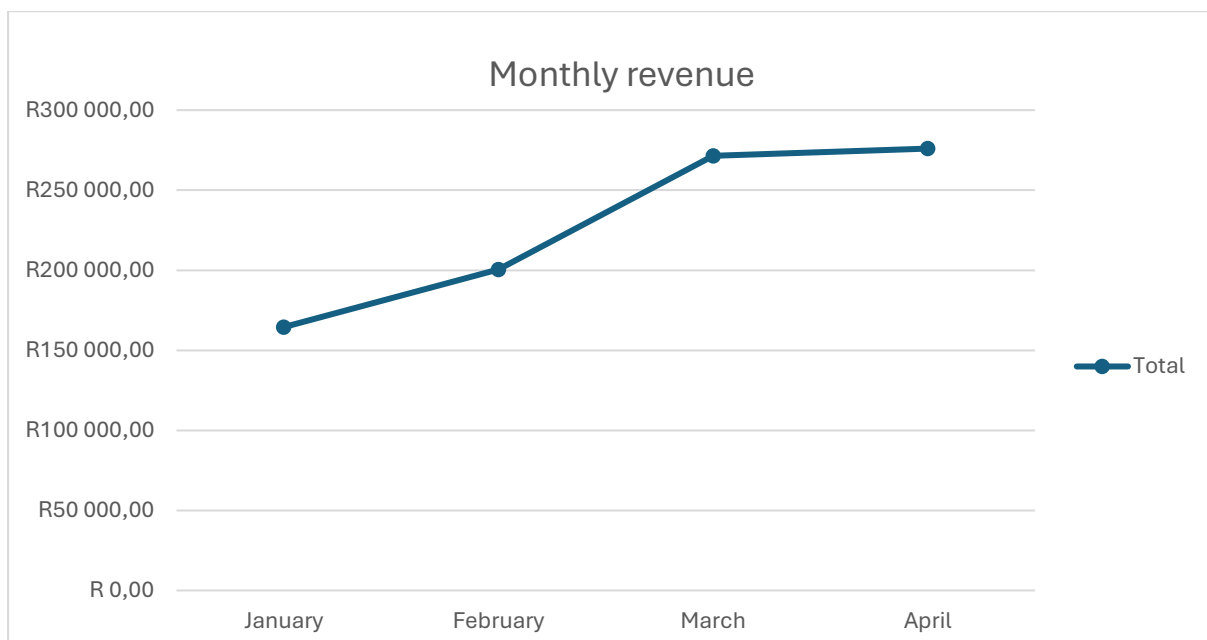

In terms of sales per region the best performing is the North region with 47 total sales between January and May bringing in a total revenue R260 500. However despite the East region selling the less items they were able to bring in the highest revenue at R270 000 which leads us to my next finding.

2. Highest revenue-generating products

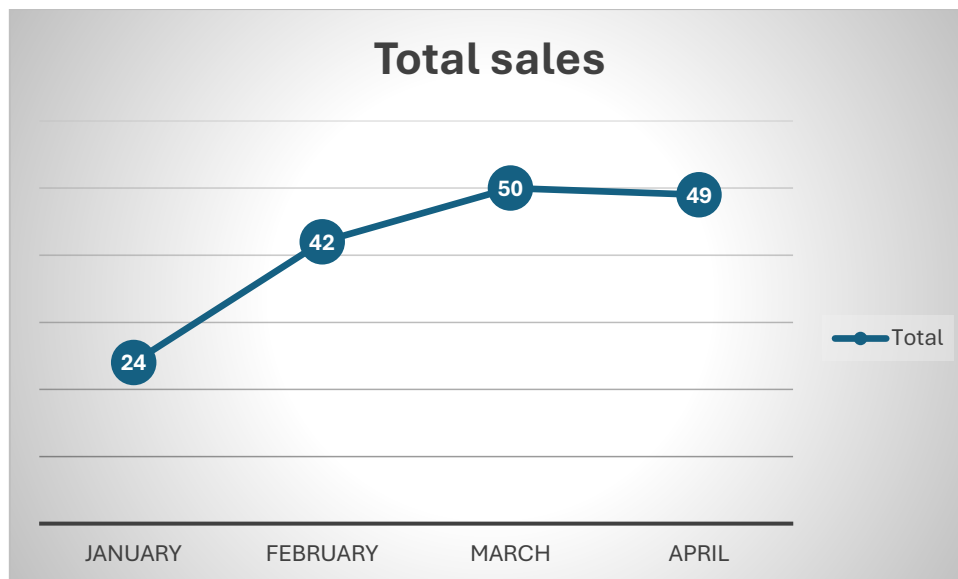

The highest revenue generating product sold is the phone product. Selling the highest quantity at 55 products and bringing in the highest revenue at R440 000 with 48% of the total revenue. The second leading product are chairs with 27% of total sales. From this we can conclude that people like to sit on their phones.

3. Sales trends over time

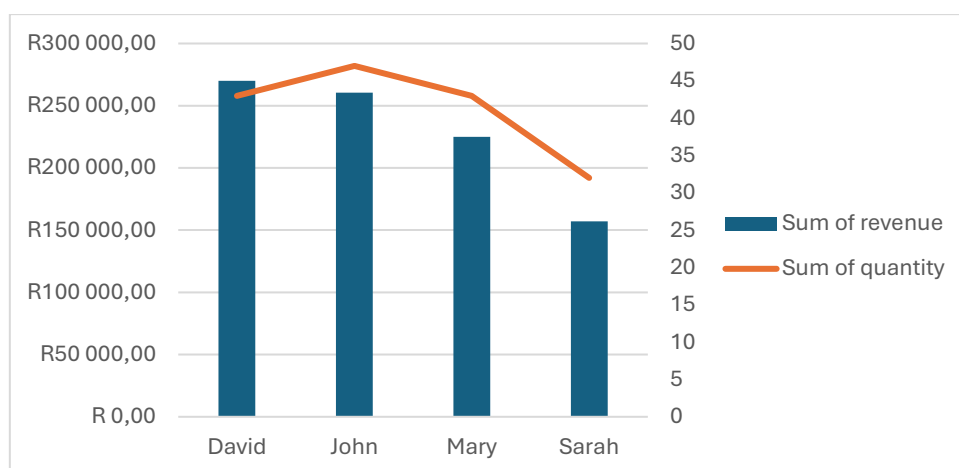

From this chart we can conclude that sales revenue picked up as the year progressed bringing in more revenue in later months

This chart tells us the exact number of sales from each month. March has the highest number of sales at 50 products. However, despite April selling less products it still generated a higher revenue than March.

4. Top-performing salespeople

In terms of revenue David brought in the most revenue, however John made the most sales. Mary and Sarah did not perform as effectively with lower sales and generated revenue.

5. Actionable business recommendations

1. Mary, John and David were able to make a similar number of sales. Sarah's performance however deviates a bit more from the others, this could be due to region or to the salesperson's performance. The business could invest in better advertising for this region or better training of their salesperson.
2. With there being a higher demand for phones and chairs, it would be advisable to stock more on these products and less on the lesser performing products like laptops.

3. As per the chart below, we know that electronics are better selling than furniture in terms of actual units sold, it also generates a higher revenue because the average cost of electronics is higher than furniture and sell more consistently throughout time. This business could stand to benefit from stocking more electronics than furniture.
